Jurnal 1	
Judul	Ketepatan Kodefikasi Sebab Dasar Kematian pada Sertifikat Kematian di Rumah Sakit Pusat Angkatan Darat Gatot Soebroto
Penulis	Risma Mei, Laela Indrawati, Deasy Rosmala, Lily Widjaya
Tahun Publikasi	2022
Metode Penelitian	Kuantitatif
Kategori pada tujuan khusus	<input checked="" type="checkbox"/> √ <input type="checkbox"/> √
	Tujuan Khusus 1 Tujuan Khisus 2
Abstrak	<p>Sebab Dasar Kematian adalah sebab-sebab kematian sebagai segala penyakit, kondisi sakit atau luka yang menyebabkan atau turut menyebabkan kematian jika tidak diderita oleh pasien maka ia tidak akan meninggal. Tujuan penelitian adalah untuk mengetahui persentase akurasi kodifikasi penyebab utama kematian di RSPAD Gatot Soebroto. Populasi penelitian adalah 165 rekam medis pasien yang meninggal pada tahun 2019. Jumlah sampel adalah 62 rekam medis kematian yang diambil dengan teknik random sampling. Instrumen penelitian berupa pedoman wawancara, pedoman observasi, ICD-10. Persentase akurasi kode penyebab kematian di RSPAD Gatot Soebroto tahun 2019 menunjukkan akurasi kode 82% akurat dalam menentukan penyebab kematian dan 18% tidak akurat karena tidak ada cross check pada tabel MMDS . Lebih baik mengkodekan semua diagnosis dalam sertifikat kematian dan menggunakan aturan kematian, baik Prinsip Umum, Aturan 1, 2 dan 3 dan merujuk ke tabel MMDS untuk memberikan kode yang akurat.</p>
Simpulan	<ol style="list-style-type: none"> 1. Di Rumah Sakit Pusat Angkatan Darat Gatot Soebroto hanya ada SPO koding secara umum, tidak ada SPO untuk koding khusus kematian. Dari 62 Rekam Medis pasien meninggal dunia

diperoleh hasil Ketepatan Kodefikasi Sebab Dasar Kematian sebanyak 46 Rekam Medis (74%). Dan hasil Ketidaktepatan Kodefikasi Sebab Dasar Kematian sebanyak 16 Rekam Medis (26%) karena koder tidak melakukan cross cek pada Tabel MMDS. Faktor faktor yang menyebabkan Ketidaktepatan Kodefikasi sebab dasar Kematian pada Sertifikat Kematian, Petugas Koding kematian mendapatkan file sertifikat medis penyebab kematian salinan ke tiga sehingga tulisan diagnosis dokter kurang jelas. Tulisan dokter yang sering kali tidak terbaca. Tidak adanya SPO khusus untuk koding kematian. Kurangnya SDM khusus koding kematian.

Jurnal 2

Judul	Tinjauan Keakuratan Kode Sebab Dasar Kematian Pada Sertifikat Kematian di RSUP Dr. Soeradji Tirtinegoro Klaten	
Penulis	Eni Nur Rahmawati, Sri Lestari	
Tahun Publikasi	2018	
Metode Penelitian	Deskriptif	
Kategori pada tujuan khusus	<input checked="" type="checkbox"/> Tujuan Khusus 1	<input checked="" type="checkbox"/> Tujuan Khusus 2
Abstrak	<p>Keakuratan kode sebab dasar kematian digunakan sebagai pertimbangan dalam pengambilan keputusan di RSUP dr. Soeradji Tirtonegoro Klaten, tetapi belum melaksanakan penentuan kode sebab dasar kematian sesuai dengan ICD-10. Berdasarkan survei awal didapatkan hasil sertifikat kematian pasien 100% lengkap terisi. Sedangkan keakuratan penentuan kode sebab dasar kematian pada</p>	

sertifikat kematian berdasarkan tabel MMDS di RSUP dr. Soeradji Tirtonegoro Klaten sebesar 90 % tidak akurat dan 10% akurat. Penelitian ini bertujuan untuk mengetahui keakuratan kode sebab dasar kematian pada sertifikat kematian berdasarkan tabel MMDS di RSUP dr. Soeradji Tirtonegoro Klaten. belum terdapatnya prosedur pencatatan pengisian diagnosis sebab kematian pada sertifikat kematian, belum terdapatnya prosedur pengkodean sebab dasar kematian, prosentase kelengkapan pengisian diagnosis 100% lengkap terisi, prosentase keakuratan kode sebab dasar kematian berdasarkan tabel MMDS 90.32% tidak akurat. Prosentase ketidakakuratan tertinggi yaitu 67.86% disebabkan kesalahan menentukan kode berdasarkan prinsip umum. Faktor yang mempengaruhi ketidaklengkapan pengisian diagnosis sebab kematian yaitu tidak adanya SPO pengisian diagnosis dan urutan penulisan yang belum sesuai ICD-10 oleh dokter. Faktor yang menyebabkan ketidakakuratan kode diagnosis yaitu tidak adanya SPO, penulisan diagnosis dan pengkodean yang belum sesuai aturan ICD-10, dan audit coding.

Simpulan

ketidakakuratan kode lebih tinggi dari kode yang akurat. Saran sebaiknya dibuat SPO pengisian diagnosis sebab kematian bagi dokter, SPO pengkodean sebab dasar kematian bagi staff coder, pelatihan pengkodean sebab dasar kematian, penyediaan MMDS bagi staff coder, dan dilaksanakan kegiatan audit coding.

Kategori pada tujuan khusus	<input checked="" type="checkbox"/> ✓	<input type="checkbox"/>
	Tujuan Khusus 1	Tujuan Khusus 2
Abstrak	<p>Sertifikat kematian merupakan sumber data penting tentang kematian dan data statistik, hal ini berpengaruh dengan mutu pelayanan. Oleh karena itu harus seakurat mungkin sehingga mencerminkan mutu pelayanan kesehatan yang ada. Penelitian ini bertujuan untuk menganalisis keakuratan sertifikat kematian di fasilitas pelayanan kesehatan dengan menggunakan 5 tahun data penelitian dari jurnal yang dipublikasi dengan rentang tahun 2017-2020. Penelitian ini mengakumulasi dan mengintegrasikan studi yang telah ada terhadap 15 artikel sebagai sampel. Hasil penelitian menunjukkan bahwa jumlah sertifikat kematian di fasilitas pelayanan kesehatan yang akurat sebesar 49,82%, sedangkan data yang tidak akurat pada sertifikat kematian sebesar 50,18%. Data keakuratan meliputi kelengkapan, keterbacaan dan ketepatan dalam penentuan Underlying Cause of Death (UCOD).</p>	
Simpulan	<p>Hasil penelitian menunjukkan bahwa jumlah sertifikat kematian di fasilitas pelayanan kesehatan yang akurat sebesar 49,82%, sedangkan data yang tidak akurat pada</p>	

sertifikat kematian sebesar 50,18%. Data keakuratan meliputi kelengkapan, keterbacaan dan ketepatan dalam penentuan UCOD. Hal ini menunjukkan rendahnya keakuratan data penyebab kematian pasien dan mempengaruhi statistik kematian di fasilitas pelayanan kesehatan. Pelatihan dan pendampingan kodifikasi dalam penentuan UCOD pada sertifikat kematian harus diupayakan pada setiap fasilitas pelayanan kesehatan serta penelitian selanjutnya guna meningkatkan keakuratan UCOD pada sertifikat kematian

Judul	<i>Using national inpatient death rates as a benchmark to identify hospitals, with inaccurate cause of death reporting²</i>	
Penulis	Jennifer Llyod, Ehsan Jahanpour, Brian Angel, Craig Ward, Andy Hunter, Cherri Baysinger, George Turabelidze	
Tahun Publikasi	2017	
Metode Penelitian	Kuantitatif	
Kategori pada tujuan khusus	<input checked="" type="checkbox"/> Tujuan Khusus 1 <input type="checkbox"/> Tujuan Khusus 2	
Abstrak	<p>Reporting causes of death accurately is essential to public health and hospital-based programs; however, some U.S. studies have identified substantial inaccuracies in cause of death reporting. Using CDC's national inpatient hospital death rates as a benchmark, the Missouri Department of Health and Senior Services (DHSS) analyzed inpatient</p>	

death rates reported by hospitals with high inpatient death rates in St. Louis and Kansas City metro areas. Among the selected hospitals with high inpatient death rates, 45.8% of death certificates indicated an underlying cause of death that was inconsistent with CDC's Guidelines for Death Certificate completion. Selected hospitals with high inpatient death rates were more likely to overreport heart disease and renal disease, and underreport cancer as an underlying cause of death. Based on these findings, the Missouri DHSS initiated a new web-based training module for death certificate completion based on the CDC guidelines in an effort to improve accuracy in cause of death reporting

Simpulan

The findings in this study are subject to at least three limitations. First, 12% of medical charts designated for review were unavailable or did not have sufficient information, which might have resulted in sampling bias. Second, the study was based on the assumption that the hospital medical charts provide more accurate representation of the cause of death than the death certificates, although this might not be correct in all cases. Finally, although this study compared cause of death across broad disease categories, the determination of the underlying cause of death is not always straightforward and another reviewer might have reached a different conclusion.

Judul	<i>Are cause of death data for Shanghai fit for purpose? A retrospective study of medical records</i>
Penulis	Lei Chen, Tian Xia, Rasika Rampatige, Jun Chen, Hang Li, Martin, Fan Wu
Tahun Publikasi	2022

Metode Penelitian	Kuantitatif
Kategori pada tujuan khusus	<input checked="" type="checkbox"/> <input type="checkbox"/> Tujuan Khusus 1 Tujuan Khisus 2
Abstrak	To assess the quality of cause of death reporting in Shanghai for both hospital and home deaths. 1757 medical records (61% males, 39% females) of deaths that occurred in these sample sites in 2017 were reviewed using established diagnostic standards. The original UCODs as assigned by doctors in the study facilities were of relatively low quality, reduced to 31% of deaths assigned to garbage codes, reduced to 2.3% following data quality and follow back procedures routinely applied by the Shanghai CRVS system.
Simpulan	Training in correct death certification for clinical doctors, especially tertiary hospital doctors, is essential to improve UCOD quality in Shanghai. A routine quality control system should be established to actively track diagnostic performance and provide feedback to individual doctors or facilities as needed.

Jurnal 8

Judul	<i>Accuracy and the factors influencing the accuracy of death certificates completed by first-year general practitioners in Thailand</i>
Penulis	Chaiwat, Prateep, Charoen, Pochamana, Weerachai
Tahun Publikasi	2018
Metode Penelitian	Kuantitatif
Kategori pada tujuan khusus	<input checked="" type="checkbox"/> <input type="checkbox"/> Tujuan Khusus 1 Tujuan Khisus 2
Abstrak	Although death certificates (DCs) provide valuable health information which may help to guide local health policies

and priorities, there is little information concerning their validity in Thailand. First-year general practitioners (GPs) have a major role in DC completion, especially in provincial general hospitals. The aim of this study was to evaluate the accuracy and factors influencing the accuracy of DCs completed by first-year GPs in Thailand, compared with the cause of death (COD) derived from medical records by experts. This retrospective study was conducted at 14 provincial general hospitals in Thailand during the June 2011 to May 2012 study period. Medical records and DCs completed by first-year GPs who graduated from 16 Thai medical schools were sampled. The cause of death recorded on the DCs was compared with the medical conditions and histories derived from patient medical records. A cross-sectional survey of the 210 GPs who completed the DCs reviewed in this study was also conducted. Respondent GPs' demographic characteristics, factors associated with COD, and COD coding system were evaluated.

Simpulan

This is the first study documenting gaps and disparities in DC accuracy, and factors influencing completion of DCs among first-year GPs in Thailand, based on a clinical assessment of medical records. GPs made errors on 63.1% of DCs. This finding suggests that proven education, system-related support, and additional training interventions specific to DC completion are required.

Jurnal 9

Judul	<i>Accuracy of death certificates and assessment and factors for misclassification of UCOD</i>
Penulis	Makiko Naka, Noriko Tanaka, Tomio, Takuya, Motoji Sawabe
Tahun Publikasi	2017

Metode Penelitian	Kuantitatif
Kategori pada tujuan khusus	<input checked="" type="checkbox"/> <input type="checkbox"/> Tujuan Khusus 1 Tujuan Khisus 2
Abstrak	Cause of death (COD) information taken from death certificates is often inaccurate and incomplete. However, the accuracy of Underlying CODs (UCODs) recorded on death certificates has not been comprehensively described when multiple diseases are present. The concordance rate was relatively high for cancer (81%) but low for heart disease (55%) and pneumonia (9%). The overall concordance rate was 48%. Sex and comorbidity did not affect UCOD misclassification rates, which tended to increase with patient age, although the association with age was also not significant. The strongest factor for misclassification was UCODs ($P < 0.0001$). Sensitivity and specificity for cancer were very high (80% and 96%, respectively), but sensitivity for heart disease and pneumonia was 60% and 46%, respectively. Specificity for each UCOD was more than 85%.
Simpulan	Researchers should be aware of the accuracy of COD data from death certificates used as research resources, especially for cases of elderly patients with pneumonia.

Judul	Tinjauan Ketepatan Kode Diagnosis Utama Penyebab Dasar Kematian Berdasarkan ICD-10
Penulis	Ade Supriyadi, Wagiran
Tahun Publikasi	2018
Metode Penelitian	Kuantitatif
Kategori pada tujuan khusus	<input checked="" type="checkbox"/> <input checked="" type="checkbox"/> Tujuan Khusus 1 Tujuan Khisus 2

Abstrak

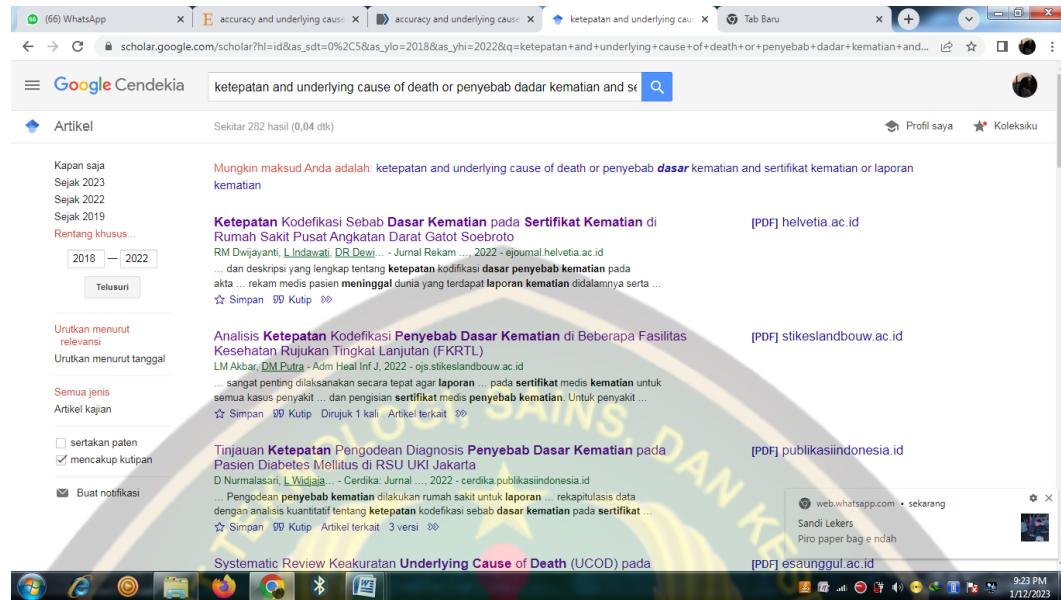

Penentuan kode penyebab dasar kematian merupakan salah satu fungsi yang penting dari unit kerja rekam medis yang membutuhkan ketelitian. Untuk menentukan kode, petugas harus memperhatikan prosedur atau aturan yang ditetapkan oleh WHO di dalam ICD-10. Penelitian ini bertujuan mengetahui Presentasi ketepatan kode diagnosis penyebab dasar kematian berdasarkan ICD-10 di RSUD M. Th. Djaman Sanggau Tahun 2016. Jenis penelitian ini adalah deskriptif dengan menggunakan pendekatan cross sectional. Metode yang digunakan adalah observasi dan wawancara. Populasi penelitian sebanyak 3 orang petugas rekam medis dan sampel dalam penelitian ini adalah petugas rekam medis dengan total populasi yaitu seluruh petugas rekam medis dengan jumlah 3 orang. Hasil penelitian ini berdasarkan perhitungan Jumlah Ketepatan sebesar 83% (83 data kematian), sedangkan ketidaktepatan sebanyak 17% (17 data kematian) dari 100 sampel yang diambil dalam penelitian. Masih ada ketidaktepatan akibatnya salah satu faktor-faktor yang mempengaruhi ketidaktepatan adalah tidak ada Standar Operasional Prosedur dan sosialisasi tentang cara penentuan kode penyebab dasar kematian dan penyediaan tabel Medical Mortality Data System (MMDS) untuk membantu dalam penetapan kode penyebab dasar kematian.

Simpulan

Pelaksanaan penentuan kode diagnosis penyebab dasar kematian di RSUD M.Th Djaman Sanggau belum sesuai dengan prosedur yang ada didalam ICD-10 karena tidak ada proses reseleksi kode penyebab dasar kematian dengan presentasi ketepatan penentuan kode diagnosis penyebab dasar kematian di RSUD M.Th Djaman Sanggau yaitu 83% dan ketidaktepatan mencapai presentase 17%.

Using National Inpatient Death Rates as a Benchmark to Identify Hospitals with Inaccurate Cause of Death Reporting — Missouri, 2009–2012

Jennifer Lloyd, MSPH¹; Ehsan Jahanpour, MS²; Brian Angel³; Craig Ward, MSW⁴; Andy Hunter, MA⁵; Cherri Bayinger, MS¹; George Turabeldzic, MD, PhD¹

Reporting causes of death accurately is essential to public health and hospital-based programs; however, some U.S. studies have identified substantial inaccuracies in cause of death reporting. Using CDC's national inpatient hospital death rates as a benchmark, the Missouri Department of Health and Senior Services (DHSS) analyzed inpatient death rates reported by hospitals with high inpatient death rates in St. Louis and Kansas City metro areas. Among the selected hospitals with high inpatient death rates, 45.8% of death certificates indicated an underlying cause of death that was inconsistent with CDC's Guide for Death Certification (*1*). Hospitals with high inpatient death rates were more likely to over-report heart disease and renal diseases, and under-report cancers as an underlying cause of death. Based on these findings, the Missouri DHSS initiated a new web-based training module for death certificate completion based on the CDC guidelines (*2*).

Among all nonfederal, noninstitutional, short-stay hospitals or general hospitals in Missouri that each reported ≥20 deaths per year, 32 were purposefully selected for the study. All selected hospitals were in the Kansas City metro area (15) or the St. Louis metro area (17). Combined, these hospitals reported half (50.7%) of all deaths in the state. Heart disease, cancer, and renal disease were selected from among the 10 top causes of death in the state, because death certificate-based reported deaths resulting from these conditions were substantially higher in Missouri than in the rest of the United States.

to detect multiple outliers in a univariate, approximately normally distributed data set (two-sided test, $\alpha = 0.1$) was applied to the calculated inpatient hospital death rates data set. Hospitals with high outlying death rates in any of the three disease categories were selected. The rest of the normalized data set was then tested for normality again with the Shapiro-Wilk test (Figure). After calculating the standard deviation (SD) of the normalized data set, the inpatient death data were plotted around the U.S. benchmark, and a tolerance interval (± 2 SD) based on the CDC's estimation of the U.S. 2010 population death rate for cancer, heart disease, and renal disease were used as benchmarks (*3*). Among hospitals with inpatient death rates ≥ 2 SD above the U.S. benchmark in any disease category, a sample of the hospitals that contributed the most deaths were selected. These hospitals, as well as the hospitals identified as outliers, were included in the analysis (Figure).

Medical charts for review were randomly selected from a data set that included all death certificates submitted by the hospital during 2009–2012 for the three disease categories. Sample sizes for the chart review were calculated to detect at least a 20% death certificate completion error rate, and ranged from 18 to 33 per hospital. Medical chart reviews were conducted by one physician and one epidemiologist who were trained in death certificate completion according to CDC guidelines (*2*). Death certificates were not available to the reviewers at the time of chart reviews. After a thorough review of medical charts with

Abstract

Objectives To assess the quality of cause of death reporting in Shanghai for both hospital and home deaths.

Design and setting Medical records review (MRR) to independently establish a reference data set against which to compare original and adjusted diagnoses from a sample of the hospital and hospital-based home deaths in Shanghai.

Participants 1757 medical records (815 males, 39% females) of deaths that occurred in these sample sites in 2017 were reviewed using established diagnostic standards.

Interventions None.

Primary outcome Original underlying cause of death (UCOD) from medical facilities.

Secondary outcome Resulting UCOD assigned from the Shanghai Statistical Bureau's Chinese Statistics (CNS) system and MRR UCODs from MRR.

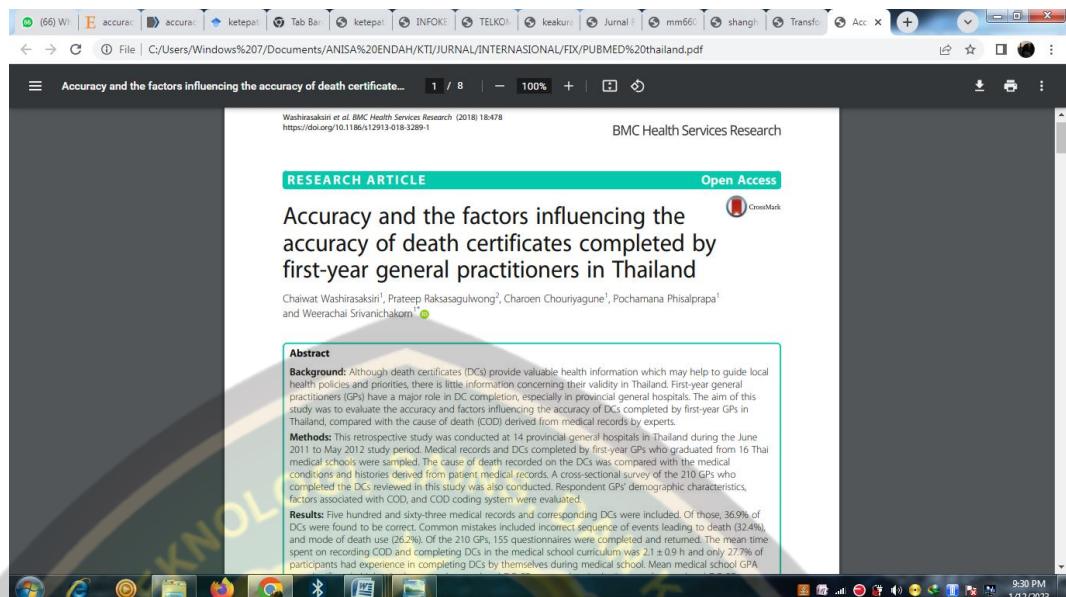

Results The original UCODs as assigned by doctors in the study facilities were of relatively low quality, reduced

Strengths and limitations of this study

- Assessment of diagnostic accuracy at the individual level for over 1700 deaths.
- Established ex ante diagnostic criteria used to derive reference diagnosis for assessing data quality, thus reducing subjectivity in choice of reference diagnoses.
- Only primary documentation for the top 25 cause of deaths was reviewed by one trained doctor, thus increasing risk of potential diagnostic bias for reference diagnoses.

which although experiencing a relatively low mortality rate and high life expectancy (80.2 years),¹¹ faces a number of health-related challenges stemming from an ageing population,
